

(a) Default: kinetic spark

Impact drives a fast column onto the anvil.
The re-shock lights the deuterium-tritium plug.
 $\text{Neutron} + {}^6\text{Li} \rightarrow \text{tritium} + \alpha$, both charged.

(b) Fission-assisted spark

The implosion crushes a small fissile plug
until it fissions and heats the fuel.
Surer ignition, a little fission waste, treaty-barred.

Tungsten tamper, graded heavy to light

Lithium-6 absorber (${}^6\text{LiD}$ or ${}^6\text{LiH}$)

Lithium deuteride fuel

Deuterium-tritium plug

Carbon liner on tungsten anvil

Fissile plug

Schematic, not to scale
